The GRADE approach to Network Meta-analysis

Network meta-analysis is becoming more and more prominent as a source of the evidence for the practice of evidence-based medicine. Almost all NMAs to date are fundamentally flawed in that they fail to provide quality of evidence ratings for each paired comparison in the network. The GRADE working group has suggested a methodology to remedy this deficiency.

**Gordon Guyatt** is a historical relic from the early days of CEB. He’s been around long enough that he’s managed to get involved in many major developments in clinical epidemiology and evidence-based medicine of the last 30 years including health status measurement, and randomized trial, systematic review, and guideline methodology.
